Sifter3 is a Python 3 implementation of the Sieve email filter language (RFC 5228)

CHAPTER 1

FEATURES

- Supports all of the base Sieve spec from RFC 5228, except for features still listed under TODO below
 - multiline strings (since version 0.2.2)
 - bracketed comments (since version 0.2.4)
- Extensions supported:
 - regex (draft-ietf-sieve-regex-01)
 - body (RFC 5173)
 - variables (RFC 5229)
 - enotify (RFC 5435, particularly the mailto method RFC 5436)
 - imap4flags (RFC 5232: setflag, addflag, removeflag; not supported: hasflags, :flags)
 - reject and ereject (RFC 5429) (since version 0.2.4)
 - ihave (RFC 5463) (since version 0.2.5)

CHAPTER 2

INSTALL

```
pip install sifter3
```

CHAPTER 3

EXAMPLE

```
import email
import sifter.parser
rules = sifter.parser.parse_file(open('my_rules.sieve'))
msg = email.message_from_file(open('an_email_to_me.eml'))
msg_actions = rules.evaluate(msg)
```

In the above example, `msg_actions` is a list of actions to apply to the email message. Each action is a tuple consisting of the action name and action-specific arguments. It is up to the caller to manipulate the message and message store based on the actions returned.

CHAPTER 4

COMMAND LINE

The output of the command line tool can be parsed as json.

```
$ sifter tests/evaluation_1.rules tests/evaluation_1.msg  
[['redirect', 'acm@example.com']]
```

CHAPTER 5

WARNINGS

- No thought has been given yet to hardening against malicious user input. The current implementation is aimed at users that are running their own sieve scripts.
- The current implementation is not optimized for performance, though hopefully it's not too slow for normal inputs.

CHAPTER 6

TODO

- An example adaptor that provides Unix LDA behavior using sieve for filtering
- Base spec features not yet implemented:
 - encoded characters (section 2.4.2.4)
 - message uniqueness (section 2.10.3)
 - envelope test (section 5.4)
 - handle message loops (section 10)
 - limit abuse of redirect action (section
 - address test should limit allowed headers to those that contain addresses (section 5.1)
